

Matrix Completion

Tuesday, February 27, 2024 2:45 PM

Matrix completion model:

Model Training:

① user embedding matrix:

$$A = \begin{bmatrix} \vdots & \vdots & \boxed{\vdots} & \vdots \\ \vdots & \vdots & \boxed{\vdots} & \vdots \end{bmatrix} \quad u\text{-th column: user } u : \vec{a}_u$$

② item embedding matrix:

$$B = \begin{bmatrix} \vdots & \vdots & \boxed{\vdots} & \vdots \\ \vdots & \vdots & \boxed{\vdots} & \vdots \end{bmatrix} \quad i\text{-th column: item } i : \vec{b}_i$$

③ inner product: $\langle \vec{a}_u, \vec{b}_i \rangle$: u 's interest on i

④ learn A and B such that $\langle \vec{a}_u, \vec{b}_i \rangle$ is close to actual interest score.

Matrix Completion

Tuesday, February 27, 2024 2:45 PM

Dataset:

tuple: (userID, itemID, actual interest score)

Objective:

$$\min_{A, B} \sum_{(u, i, y) \in \Omega} (y - \langle \vec{a}_u, \vec{b}_i \rangle)^2$$

Intuition: why call "matrix completion"?

$$\begin{bmatrix} 0 & 1 & 3 & 4 \\ \times & 2 & \times & 0 \\ 1 & \times & 3 & 0 \end{bmatrix}$$

3 users x 4 items.

missing: user 2 on item 1
user 2 on item 3
user 3 on item 2

learn to fill missing.

limitations:

- ① pure use userID and itemID; do not use user and item properties
- ② negative samples are NOT selected correctly
- ③ training method is NOT good:
 - ③.1 inner product is worse than cosine similarity
 - ③.2 squared error loss is worse than cross entropy.
(from regression to classification)

Matrix Completion

Tuesday, February 27, 2024 2:45 PM

Offline storage:

- ① matrix A and B (after training)
- ② index from user ID to its column \vec{a}_u in A
- ③ index related to B (complicated)

Online inference:

- ① given user ID. get its embedding vector \vec{a}_u
- ② find top k items by $\langle \vec{a}_u, \vec{b}_i \rangle$ result ranking
(Not possible to calculate $\langle \vec{a}_u, \vec{b}_i \rangle$ for each item)

"Approximate" Nearest Neighbor Search:

Example:
embedding
vector has
a dimension
of 2.
